^a The design effect calculation reflects the weights and does not incorporate the intraclass correlation coefficients. Design effect calculation: $n * (\text{sum of squared weights}) / [(\text{sum of weights}) * (\text{sum of weights})]$ ^b Margin of error is calculated around a proportion at the 95% confidence level. The maximum margin of error was calculated assuming a reported percentage of 50% and takes into account the design effect. Margin of error calculation: $\sqrt{(0.25/N) * 1.96 * V(DE)}$ ^c Areas with disproportionately high number of interviews in the sample. ^d Reasons for these differences could include household sampling, respondent sampling in the household, errors in self-reports of actual attainment, or dated population information. *Handheld data collection.
